

The Volume, Pressure and Power Regulator VPL

The digital regulator VPL for variable displacement pumps controls the operation of hydraulic drive systems and enables optimum economic use of the machines. The VPL regulates the operating variables volume flow and pressure and power output to pre-determined values, dependent on the operating mode. At the same time, the regulation may be applied to all possible combinations of these operating variables. The PC program ConDoc® or the hand terminal MT can be used to set the parameters.

VPL connection diagram

VPL Functions

Setting values

The setting values for the volume, pressure and/or power output are analogue pre-set:

- using a setpoint potentiometer
- using an external 0-10V terminal (e.g. a PLC).

As desired, fixed setting values may also be saved.

Measurement and regulation functions

- Actual valve flow measurement.
- Calculation of the actual power output value from actual pressure and valve flow.
A pressure sensor is used to record the actual pressure.
- Self-adaptive PIDT1 pressure controller with dynamic adaptation of the proportional factor to the volume flow, i.e. to the respective current operating condition.
- PIDT1 power regulator.
- PI flow controller to regulate the valve flow.
The correcting variable for the flow controller is calculated from the flow setting value and the correcting variables from the pressure and power output controllers. An additional flow controller monitors the valve flow in order to keep it steady, independent of varying valve parameters (e.g. increased winding resistance when temperatures rise).

Ramps

- Ramp function for volume, pressure and power setting values with increase and fall times which can be set separately.

Protective function

- Recognition of cable breaks if a 4-20 mA pressure sensor is used.
- Recognition of cable breaks for proportional solenoids.

VPL Function diagram

VPL Connectors

	d	z	
UB	2	UB	UB
CE3	4	AE1	AE1
SE1	6	AE2	AE2
SE2	8	PTP	PTP
SE3	10	AE3	AE3
SE4	12	PTM	PTM
SE5	14	AE5P	AE5P
SE6	16	AE5M	AE5M
SE7	18	AE4	AE4
SE8	20	UPT	UPT
PV1P	22	SG	SG
PV1M	24	CE1	CE1
PV2P	26	CE2	CE2
PV2M	28	CH	CH
SA1	30	CL	CL
DG	32	DG	DG

VPL Pin configuration

D2/Z2	UB	Supply, plus
D32/Z32	DG	Supply, minus (earth)
Z24	CE1	Current input for pressure sensor 0 (4) –20 mA
Z4	AE1	Voltage input for pressure sensor 0-10V
Z6	AE2	Voltage input for setting value volume (potentiometer, PLC)
Z10	AE3	Voltage input for setting value pressure (potentiometer, PLC)
Z18	AE4	Voltage input for setting value power (potentiometer, PLC)
D22	PV1P	Proportional pump output, plus
D24	PV1M	Proportional pump output, minus
Z20	UPT	8V Output (for potentiometers)
Z22	SG	Signal earth
Z28	CH	CAN wire H
Z30	CL	CAN wire L

VPL Dimensions

VPL Technical data

Dimensions:	160mm x 100mm x 20mm
Weight:	170g
Plug connections:	Multiple plug, DIN41612 type F, 32 contacts D sub-socket for RS232, 9 pins
Power supply:	UB = 12 ... 32V
Current input:	Approx. 60mA at 24V
Parameter settings:	Using the hand terminal MT or a PC (RS232)
Microcontroller:	ST10F269/40 MHz
Program memory:	256 kByte flash ROM
Data memory:	12 kByte RAM
Parameter memory:	64kBit EEPROM
Interfaces:	RS232, CAN
Inputs:	4 Analogue inputs, 10 bit, 0 ... 10V, of which one is a potentiometer input, usable for error recognition 1 Current input 10 Bit, 4 ... 20mA measured resistance 220Ω to earth
Outputs:	1 Current supply output, 8V, 50mA maximum for hand terminal MT 1 Proportional solenoid output, 3A maximum
Safety:	Watchdog microcontroller No terminals with sockets used Reverse pole protection
Temperature range:	-40 ... 70°C
EMV:	Industrial application: EN 50081-2 and EN 50082-2; Application in road vehicles: DIN 40839 and guideline 95/54/EG
